

MPA Assignment 2

05/05

Define progressive web app (PWA) and explain its significance in modern web development. Discuss the key characteristics that differentiate PWAs from traditional mobile apps.

A progressive web app (PWA) is a type of web application that works like a mobile app but runs in a browser.

It can be installed on a device, works offline and provides a fast and smooth user experience.

Significance of PWA in Modern web development:

- ① Cross platform compatibility
- ② Offline support.
- ③ Fast Performance
- ④ No App store required
- ⑤ Lower development cost.

Key differences between PWA & traditional Mobile apps

Features	PWA	Traditional mobile apps
Installation	Direct from browser	Download from app store.
Internet required	Works offline with caching	Usually requires internet.
Performance	Fast with service workers	Faster but needs installation.

Updates

Automatic no app
store approval

Manual update
needed.

Development
cost

Lower (one codebase
for all)

Higher (separate
apps for each
platform).

PWA's combine the best of web and mobile
apps making them efficient and user friendly.

2) Define responsive web design and explain its
importance in the context of progressive web
apps. Compare and contrast responsive, fluid and
adaptive web design approaches.

-> Definition of Responsive Web Design:

Responsive web design (RWD) is a technique that
makes web pages adjust automatically to different
screen sizes and devices. It ensures a good
user experience on mobile, tablets and desktops
without needing separate versions of website.

Importance of Responsive Design in PWA's:-

- (1) Better User Experience
- (2) Faster Load time
- (3) SEO Benefits
- (4) Cost Effective.

MP2 Assignment ②

Comparison of web design approaches.

Approach	How it works	Pros	Cons
Responsive	Uses flexible grids and CSS media queries to adjust layout	Works on all devices	Can be complex to design.
Fluid	Uses percent based widths instead of fixed pixels, so elements resize smoothly	Works well on different screen sizes, easy to implement	Less control over layout on large screens.
Adaptive	Uses fixed layout that change at specific breakpoints	Optimized for known screen sizes	More effort required to design for each screen size.

Key differences.

- Responsive adapts dynamically to all screens.
- Fluid ~~resizes~~ smoothly but may not be fully optimized
- Adaptive loads different layouts based on device types.

Q3 Describe the lifecycle of service workers, including registration, installation and activation phases.

-> Lifecycle of Service Worker:

A service worker is a script that runs in the background and helps a web app work offline, load faster and send push notifications. Its lifecycle has three main phases.

(1) Registration Phase

- The browser registers the service worker using JavaScript

Code eg.

```
if ('serviceWorker' in navigator) {  
  navigator.serviceWorker.register('sw.js').  
    .then(() => console.log('Service Worker Registered'))  
    .catch((error) => console.log('Registration failed!' +  
    error));  
}
```

This tells the browser to install and activate the service worker.

(2) Installation Phase

- The service worker downloads, necessary files (HTML, CSS, JS) and stores them in cache
- If successful it moves to the activation phase

code example:

```
self.addEventListener('install', event => {  
  event.waitUntil(C
```

MP2 Assignment 2

```
calhes open (app-cache). then (cache => {  
  return cache-add All ['/', 'index.html',  
    'styles.css'] } ) ;
```

);

);

);

• This ensures the app loads.

③ Activation Phase

- The old service worker is replaced with the new one.
- Unused cache files from the previous versions are deleted.

Final step: Fetch & Sync

once activated, the service worker intercepts network requests, serves cached files and syncs data when the internet is available.

Explain the uses of Indexed DB in service worker for data storage

→ Use of Indexed DB in service worker for data storage
Indexed DB is a browser database that stores large amounts of structured data like JSON objects. It helps PWAs work offline by saving and retrieving data efficiently.

Why use Indexed DB in service worker?

- ① Offline Support: Stores data when offline and syncs later.
- ② Efficient Storage: Saves structured data like user getting cart items or form inputs.
- ③ Faster Access: Retrieves data quickly without need a network request.
- ④ Persistent Data - Data remains saved even if the browser is closed.

How service works use Indexed DB?
opening the database
let db;

```
let request = indexedDB.open('My Database');
request.onsuccess = function(event) {
  db = event.target.result;
};
```

Creating a store and adding data

```
request.onsuccessneeded = function(event) {
  let db = event.target.result;
  let store = db.createObjectStore('Users', { keyPath: 'id' });
  store.add({ id: 1, name: 'John', age: 25 });
};
```

MP2 assignment 2

Fetching Data in Service Worker

```
let transaction = db.transaction('users', 'readonly');  
let store = transaction.objectStore('users');  
let getUser = store.get(1);
```

```
getUser.onsuccess = function() {  
  console.log('getUser result');  
};
```
